

## Antares-Data-Organizer 2.0.0

### Known issues regarding CHESTS

The correct handling of chests by the Data organizer is currently subject to the following restrictions:

- The name of the chest **must** be unique within the chest's parent folder
- The chest **should not** include Antares archives or Antares packs

**PLEASE NOTE THAT NO WARNING IS EMITTED BY THE APPLICATION IF THESE RESTRICTIONS ARE VIOLATED**

Violation of the restrictions mentioned above has the following consequences:

- Compression of a chest whose name is not unique: the pack will include a copy of the « siblings » of the chest (the pack IS NOT an exact substitute to the original folder)
- Compression of the chest including archives and/or packs : the pack will not include a copy of the (already) compressed objects (the pack IS NOT an exact substitute to the original folder)

To get around the restrictions mentioned above, the following measures can be taken:

- Name unicity commitment : a time-stamp can be added to the name of the folder before declaring it as a chest
- Presence of archives or packs : these Antares objects can be moved within standard 7-zip archives before declaring the folder as a chest
